Aplicaciones Web

Unidad N°1

UNIVERSIDAD TECNICA
FEDERICO SANTA MARIA

04. Sitios Web Responsivos

Responsividad

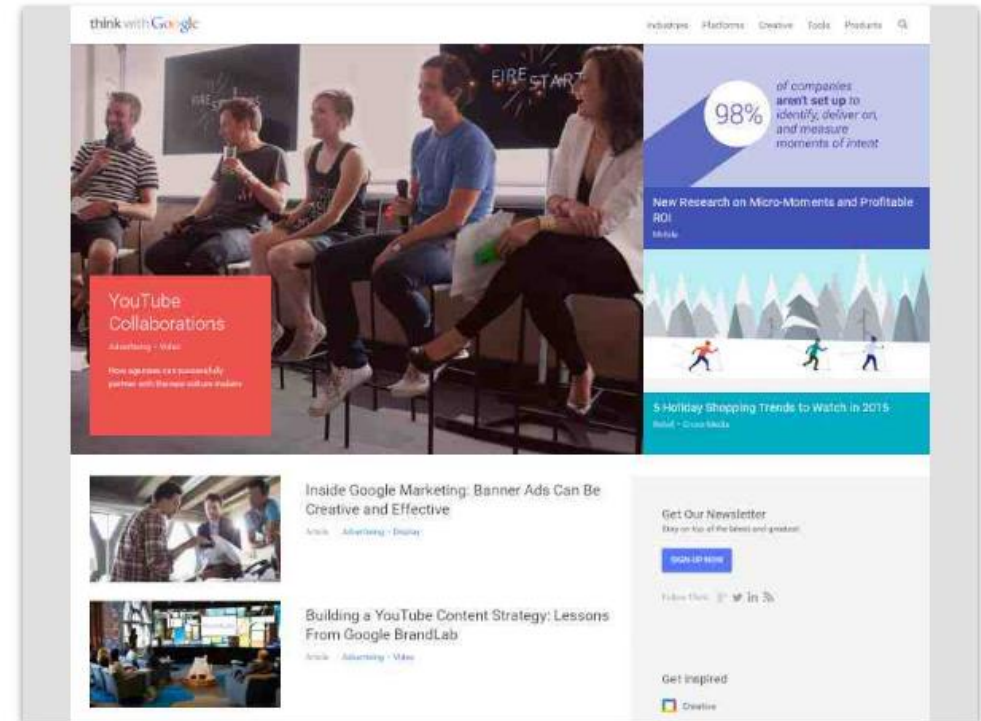

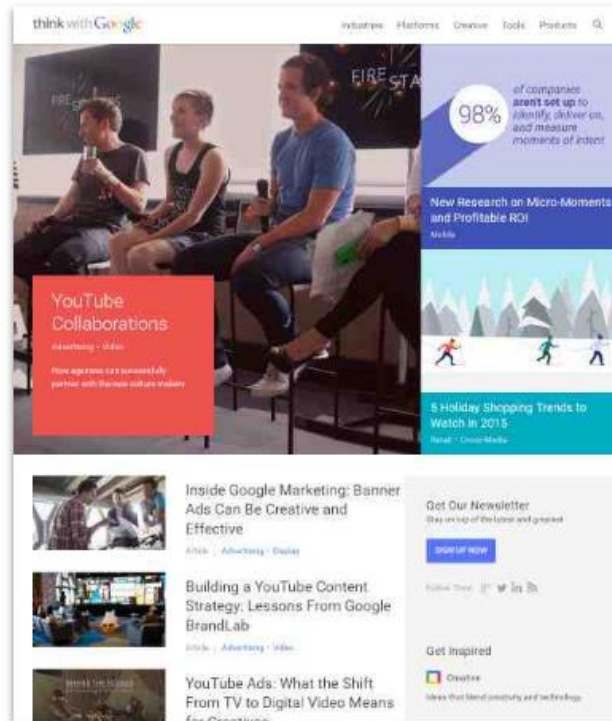

- Técnica de diseño web que busca la correcta visualización de una misma página en distintos dispositivos.
 - Desktop pc
 - Tablets
 - Móviles
 - Otros dispositivos

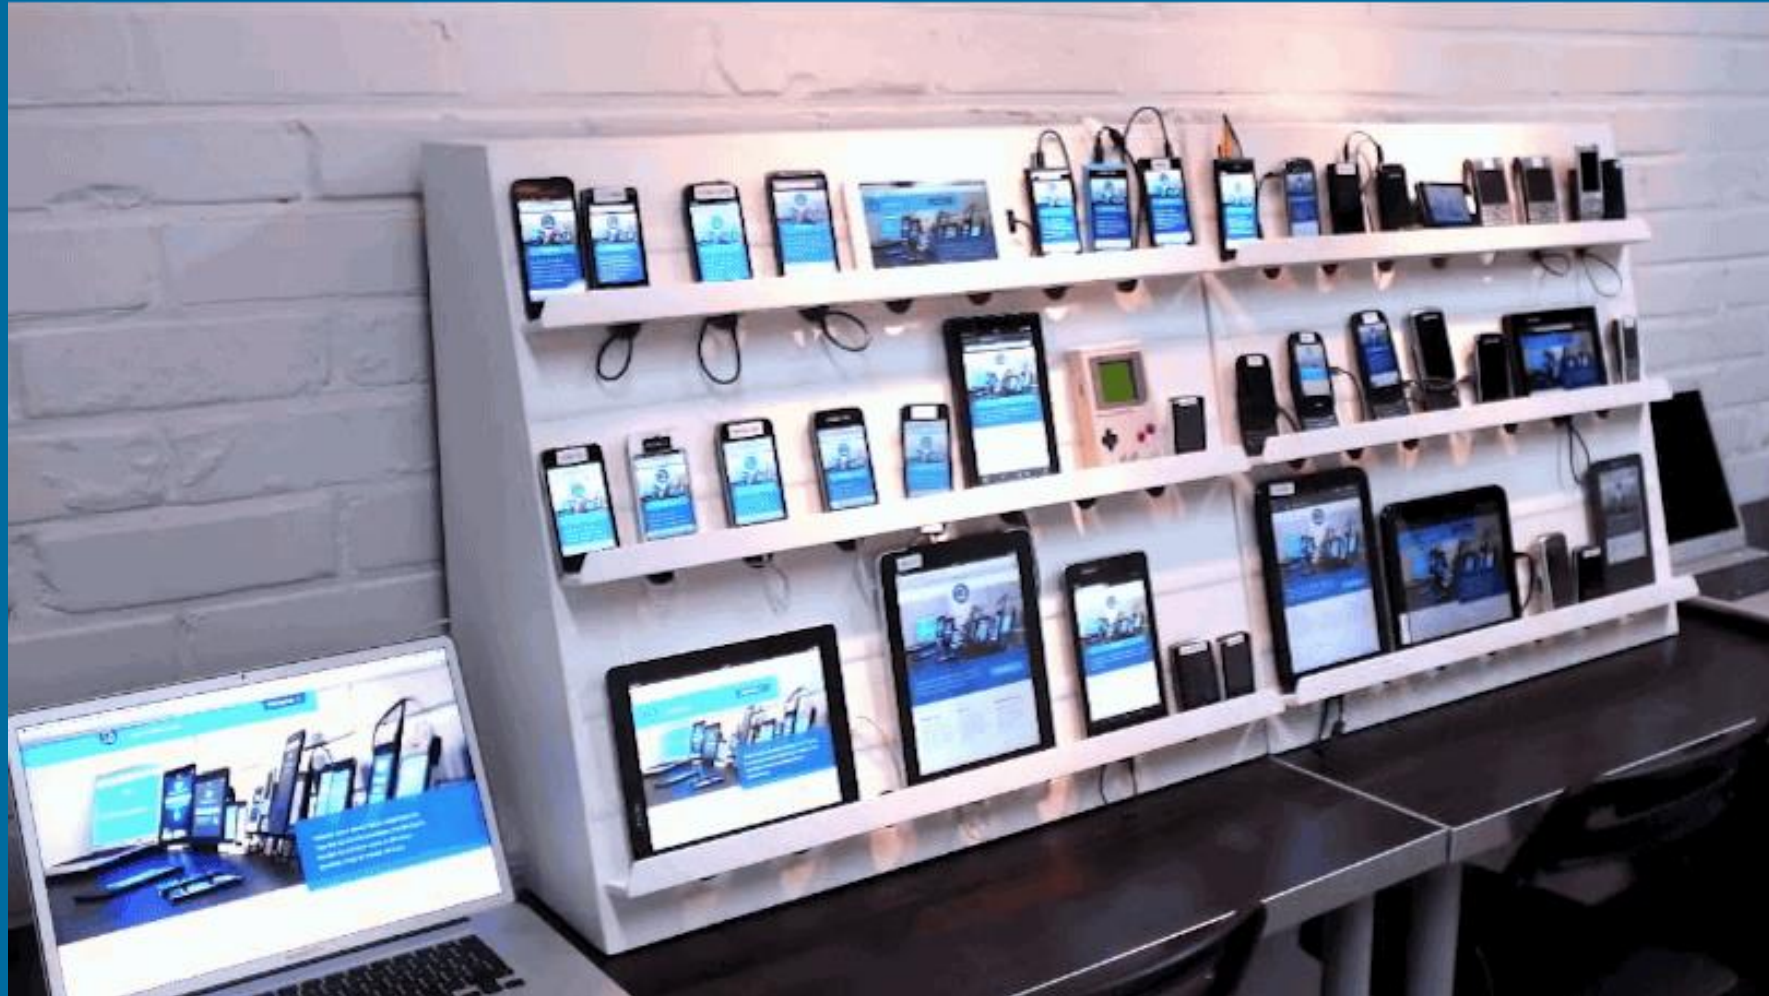

- Redimensionar y ubicar los elementos de la web de forma que se adapten al ancho de cada dispositivo
- Permite una correcta visualización y una mejor experiencia de usuario.
- Se caracteriza porque los layouts (contenidos) e imágenes son fluidos y se usa código media-queries de CSS3.

Web Responsive

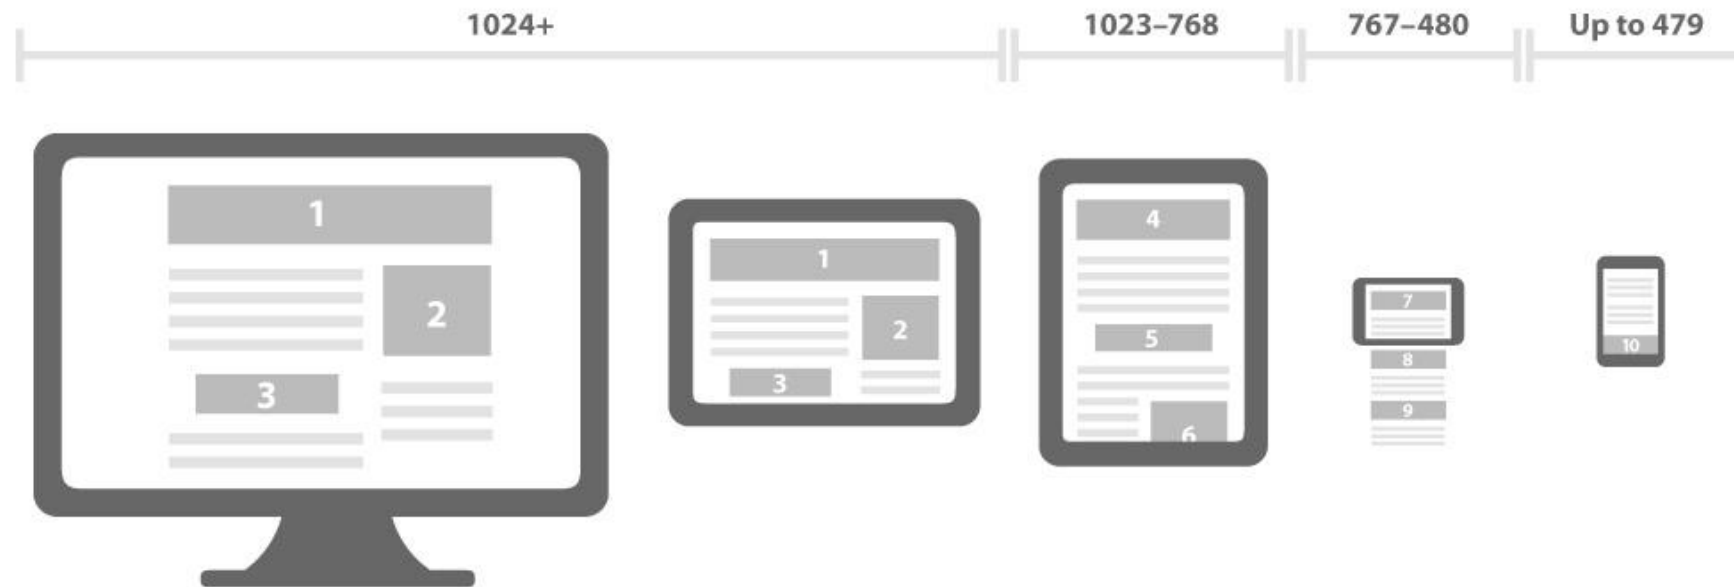

- “redimensionar y colocar los elementos de la web de forma que se adapten al ancho de cada dispositivo permitiendo una correcta visualización y una mejor experiencia de usuario”

El Problema

La Solución

[Why a wedding photographer](#)

[Telling a story with photos](#)

A wedding is an extremely important event. It brings two people and often two families together. It's not only a day where a couple expresses their love for one another, but also their commitment to being faithful partners during the ups and downs throughout life. Although people often spend a good amount of time organizing a wedding, the big day goes by extremely fast. This is why the job of a wedding photographer is extremely important. It is my job to capture all of the precious moments that couples will look back on and cherish with friends and family for years to come. I think going back at their wedding photos many times to find out how a couple's relationship strong.

[Telling a story with photos](#)

With a background in journalism, I love telling a story with pictures. A wedding is like a daylong story composed of many different elements that require that I be alert and always ready to snap a picture. It is also about knowing and applying what may happen next and where. The kind of photography I do, documentary photography, is very much about watching and waiting in a discrete manner. Finally, I find that wedding photography is one of the few jobs in the field of photography where I can work like an artist and express myself in a personal way. I think glancing back at

Para trabajar sitios web responsivos, se ha adoptado un modelo de grilla basado en columnas. El sistema consiste en dividir la pantalla en **partes iguales**, y luego adaptar el contenido a utilizar 1 o más columnas, con un máximo de definido por un framework.

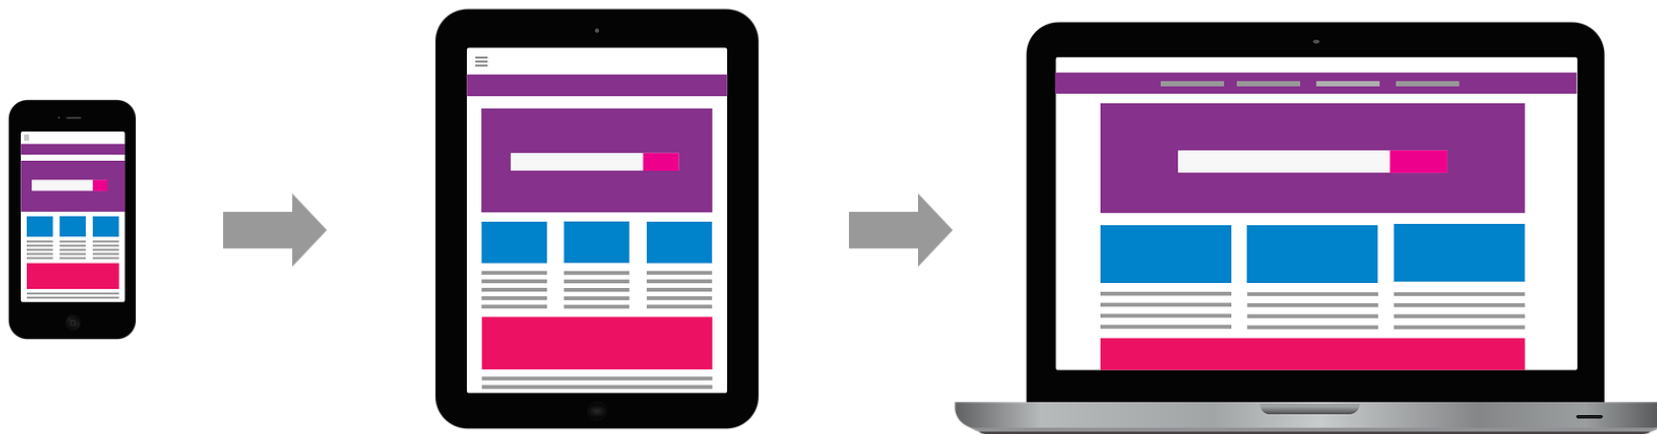

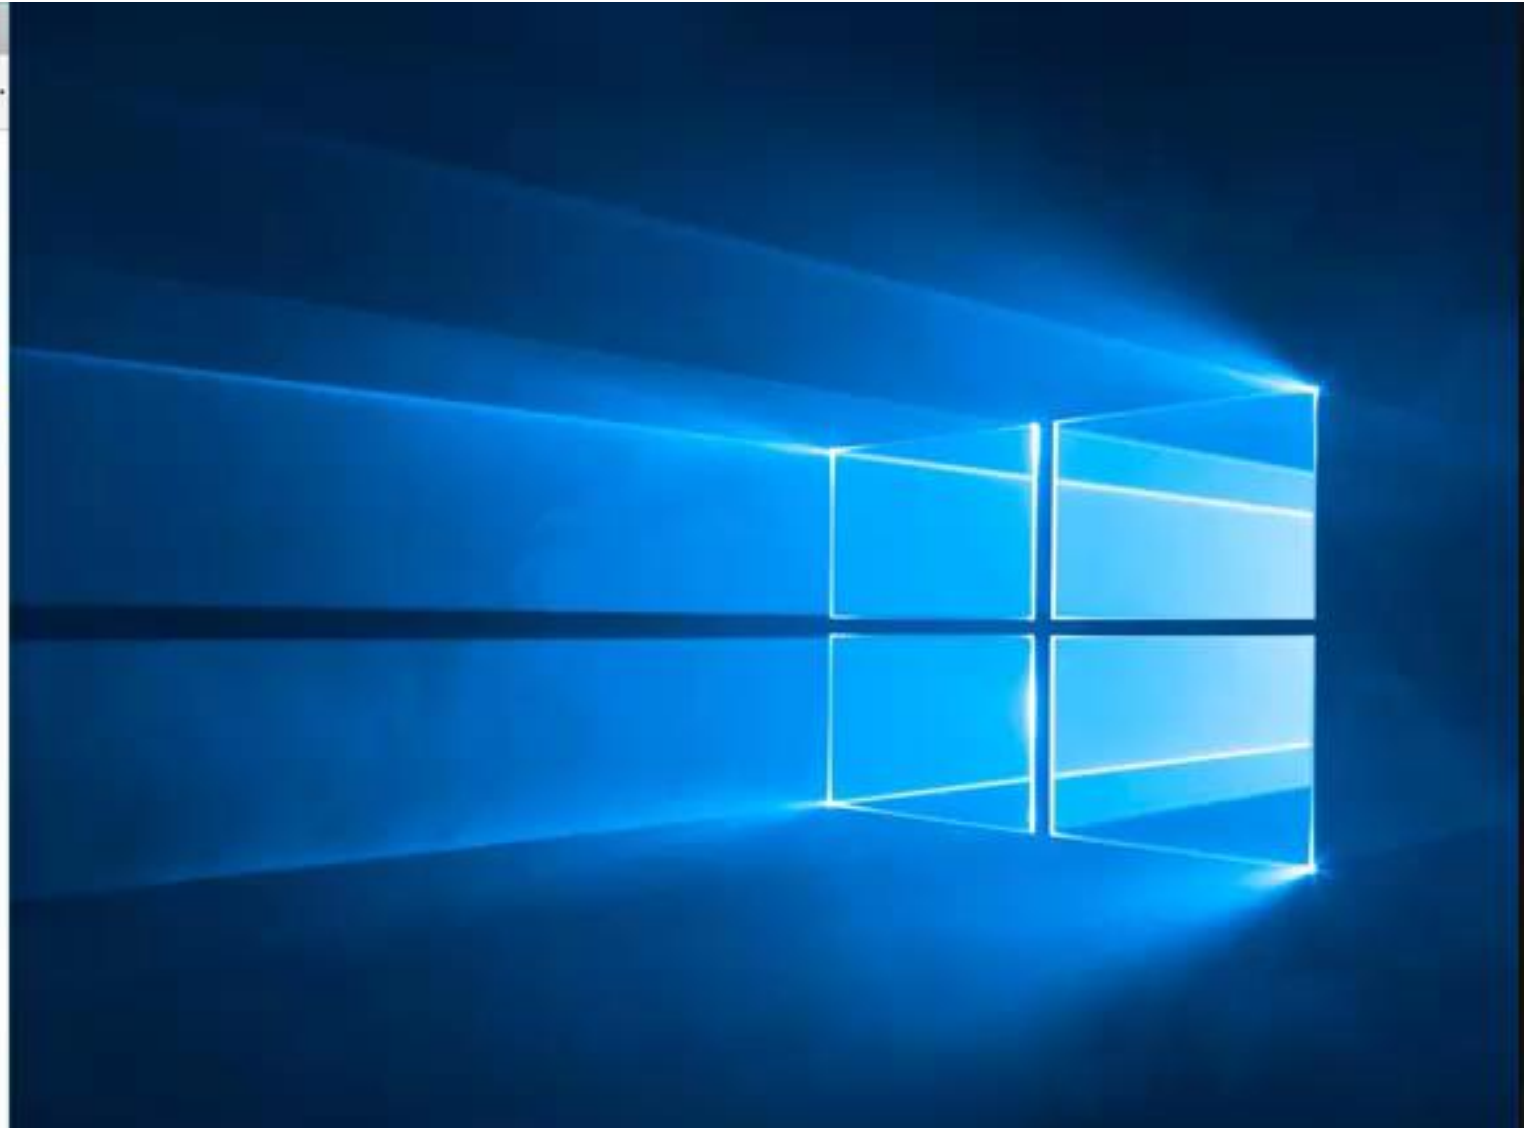

El tamaño que considera la grilla es el tamaño de **ventana del navegador**.
Al tamaño de ventana del navegador le llamamos: **Viewport**

Hoy en día, **los sitios web se diseñan primero pensando en los dispositivos móviles**, pues es desde donde se realiza la **mayor cantidad de conexiones**.

Una vez tengamos **definidas las secciones** de nuestro sitio utilizaremos la grilla para decidir **cómo se mostrará en cada pantalla** comenzando por el tamaño de pantalla más pequeño.

Enfoque Mobile First

Una de las maneras de adaptar **el contenido** de un sitio a **distintas resoluciones** es utilizar **Flexbox**, una característica incluida en CSS3 que facilita el manejo de nuestro sitio web para adaptarse a diferentes dispositivos.

Bootstrap, es un **sistema de grilla** basado en esta característica. Consiste en organizar el contenido de la página en **filas** que contendrán entre **1 y 12 columnas**.

<https://getbootstrap.com/>

	xs <576px	sm ≥576px	md ≥768px	lg ≥992px	xl ≥1200px	xxl ≥1400px
Container <i>max-width</i>	None (auto)	540px	720px	960px	1140px	1320px
Class prefix	<i>.col-</i>	<i>.col-sm-</i>	<i>.col-md-</i>	<i>.col-lg-</i>	<i>.col-xl-</i>	<i>.col-xxl-</i>
# of columns	12					
Gutter width	1.5rem (.75rem on left and right)					
Custom gutters	Yes					
Nestable	Yes					
Column ordering	Yes					

Cada **fila** será representada por un elemento `div`, u otro elemento semántico de bloque, asociada a la clase CSS **row** y, en el interior de cada fila, escribiremos tantos elementos de bloque `div` como columnas utilizará el contenido para cada tamaño, utilizando la clase **col** que corresponda.

Las **clases col** fueron definidas considerando el siguiente formato:

el prefijo `col`, seguido del tamaño de pantalla desde donde será válida la regla y de la cantidad de columnas que utilizará el elemento desde esa resolución.

		1
	xs	2
		3
	sm	4
		5
	md	6
col	-	7
	lg	8
		9
	xl	10
		11
	xxl	12

las clases `col` definen el **comportamiento desde la resolución de pantalla definida hacia adelante** por lo que, si un elemento tendrá el mismo comportamiento en todas las resoluciones, sólo basta con **definir la resolución más pequeña**
